SERVICE BULLETIN – 01/ JUNE 2006

SP 405 - SP 605

NEW LOCATION OF OPTICAL ICE LEVEL CONTROL

Starting from the following Serial Numbers:

SP 405 s/n ZC 1980

SP 605 s/n ZD 1829

The Optical Ice Level Control has been moved down by 50 mm (as shown on the photo) in order to avoid any accumulation of flake ice into the top funnel of the vertical ice chute during the tripping OFF period of the ice machine (as reported on Service Bulletin 01 March 2006, the gear motor keeps running for 3 minutes after the tripping OFF of the ice machine at BIN FULL in order to clean up all flake ice from evaporator).

Sooner the same modification will be done also on SP 125-255 as well as on SPN 1205.
